# **Project Euler #22: Names scores**

#### **Problem Statement**

This problem is a programming version of Problem 22 from projecteuler.net

You are given around five-thousand first names, begin by sorting it into alphabetical order. Then working out the alphabetical value for each name, multiply this value by its alphabetical position in the list to obtain a name score.

For example, when the list in sample is sorted into alphabetical order, PAMELA, which is worth 16+1+13+5+12+1=48, is the  $5^{th}$  name in the list. So, PAMELA would obtain a score of  $5\times48=240$ .

You are given Q queries, each query is a name, you have to print the score.

## **Input Format**

The first line contains an integer  ${\cal N}$  , i.e., number of names.

Next N lines will contain a Name.

Followed by integer  ${\cal Q}$  followed by  ${\cal Q}$  lines each having a word.

#### **Output Format**

Print the values corresponding to each test case.

#### **Constraints**

 $1 \le N \le 5200$ 

length of each word will be less than 12

 $1 \le Q \le 100$ 

# **Sample Input**

## **Sample Output**

240
